

# FayaFlex Workout Card Redesign Prompt

Copy the text below the line and paste it into your Replit AI prompt, along with the `feed_cropped.png` image we generated.

**Role:** You are an expert frontend engineer specializing in React, Tailwind CSS, and shadcn/ui.

**Task:** I need you to completely redesign the `WorkoutPostCard.tsx` component in my FayaFlex app to match the exact design in the attached reference image ( `feed_cropped.png` ).

## 1. Design Direction: "Tinted Dashboard"

The new design moves away from the old dark/heavy cards to a clean, data-forward "dashboard" look. Each workout type gets its own specific background tint, border colour, and unique layout for its metrics.

### Global Palette (FayaFlex Brand):

- Primary Green: `hsl(142 71% 30%)` / `#166534` (Tailwind `green-800` )
- Secondary Green: `#16a34a` (Tailwind `green-600` )

### Type-Specific Palettes (Background Tint / Border / Accent):

- Running:** Light green tint ( `#f0fdf4` ), green border ( `#dcfce7` ), green accent ( `#16a34a` )
- Strength:** Light red tint ( `#fef2f2` ), red border ( `#fecaca` ), red accent ( `#dc2626` )
- Cycling:** Light blue tint ( `#eff6ff` ), blue border ( `#bfdbfe` ), blue accent ( `#2563eb` )
- Yoga:** Light purple tint ( `#faf5ff` ), purple border ( `#e9d5ff` ), purple accent ( `#9333ea` )
- HIIT:** Light orange tint ( `#fff7ed` ), orange border ( `#fed7aa` ), orange accent ( `#ea580c` )

## 2. Layout Structure (Top to Bottom)

Every card shares this base structure, but the body content changes based on the workout type.

### Header:

- Avatar (left), User Name & Time (middle), Type Badge (right).
- The Type Badge is a solid pill using the accent colour with white text.
- The Avatar uses a gradient of the accent colour.

### Body (Two Columns):

- Left Column (Fixed Width):** Contains an SVG Progress Ring and the 3D product image below it. The ring colour matches the accent colour.

- **Right Column (Flexible):** Workout Title, Subtitle (e.g., "Outdoor • GPS tracked"), Personal Best pill (if applicable), and then the **Type-Specific Metrics Area**.

#### Footer:

- Top Burner badge (if applicable, in red), User Notes (italicized, grey), and the Celebrate button (right).

### 3. Type-Specific Metrics Area

This is the most important change. Instead of generic rows, the right column adapts to the workout type:

- **Running & Cycling:** Use horizontal progress bars for metrics (Duration, Calories, Pace/Speed, HR, Elevation). The bars use a gradient of the accent colour. The value is rendered in a monospace font (like `JetBrains Mono` or Tailwind's `font-mono`).
- **Strength:** Instead of bars, show a 3-column CSS Grid of "Set Chips" at the top (e.g., Bench 100kg x 4). Below the chips, show basic metric bars (Duration, Calories, Volume).
- **Yoga:** Show a 3-column flex row of "Summary Stats" (Breath, Poses, Focus %). Below that, basic metric bars.
- **HIIT:** Show a CSS flex row of vertical bars representing "Intervals" (varying heights) right above the metric rows.

### 4. Technical Constraints (CRITICAL)

1. **Do not change the component props.** `WorkoutPostCard` must still accept `content: string`, `personalBests?: PBFlags`, `isTopBurner?: boolean`. The rest of the app relies on this.
2. **Keep all existing `data-testid` attributes.** My Playwright/Cypress tests will fail if you remove `data-testid="workout-post-card"`, `data-testid="metric-calories"`, etc.
3. **Keep existing parsing helpers.** `isAutoWorkoutPost`, `getWorkoutSummary`, `parseWorkoutPost`, and `getWorkoutTheme` must remain exported with the same signatures.
4. **Use Tailwind CSS.** Use arbitrary values (e.g., `bg-[#f0fdf4]`) if the exact colour isn't in the default Tailwind palette, or map them to the closest Tailwind colours (e.g., `bg-green-50`, `border-green-100`).
5. **Dark Mode:** The attached design is Light Mode. For Dark Mode (`dark:` variants), invert the logic: use a very dark surface (e.g., `bg-zinc-900`) and keep the borders/accents vivid so they pop against the dark background.

### 5. What to Output

Please rewrite `client/src/components/WorkoutPostCard.tsx` in its entirety to implement this new design. Ensure the SVG progress ring is responsive and animated if possible.
