

Changing Permissions list in the manifest file

The issue is that when we changed the record type to `TotalCaloriesBurnedRecord`, the permission request also needs to ask for that specific type. Let me check the patch and fix it.

we also need to update the Android manifest to include the `TotalCaloriesBurnedRecord` permission. Let me check the manifest template:

The manifest template has both calorie permissions, but I notice `WRITE_TOTAL_CALORIES_BURNED` is missing. Let me add it and explain what you need to do:

The issue: Your local `AndroidManifest.xml` needs to include the Total Calories permission for it to appear in Health Connect's dialog.

What you need to do on your local machine:

Open your `android/app/src/main/AndroidManifest.xml` and make sure you have this permission (add it if missing):

```
<uses-permission  
android:name="android.permission.health.READ_TOTAL_CALORIES_BURNED"/>
```

It should be near the other health permissions.

Also important: Before testing, go to **Settings > Health Connect > App permissions > Fayaflex** and revoke all permissions, then try connecting again in the app. This ensures the new permission request is shown fresh.

The "Total calories burned" option should now appear in the Health Connect permission dialog.
